NDVI OF KILIMANJARO NATIONAL PARK

Normalized Difference Vegetation Index

KILIMANJARO
AFRICA'S ROOF
5895 M ABOVE SEA LEVEL

MAP INFORMATION

Index: NDVI
Data Source: MODIS MCD13Q1
Date: 2021
Spatial Resolution: 250 m
Coordinate Reference System (CRS): WGS 84
Projection: Geographic

LEGEND

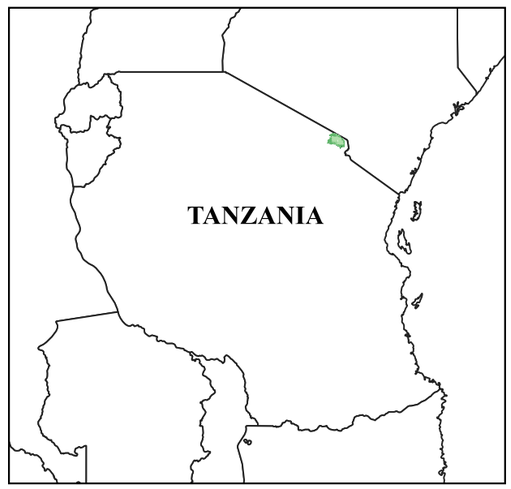

NDVI

1.0 (dense vegetation)

-1.0 (Water / No vegetation)

ABOUT NDVI

The Normalized Difference Vegetation Index (NDVI) is a remote sensing index that uses the reflectance of red and near-infrared light to estimate vegetation health, density, and vigor. Higher NDVI values indicate healthier and denser vegetation, while lower values represent bare soil, water bodies, or sparsely vegetated areas.

ECOSYSTEM CONSERVATION AND MONITORING

Healthy vegetation is essential for biodiversity conservation and ecosystem services within Kilimanjaro National Park. NDVI maps support environmental monitoring, land management, habitat assessment, and long-term conservation planning.

NOTE

High NDVI values (close to 1) indicate dense and healthy vegetation.
Low or negative values indicate bare soil, water bodies, or areas with little to no vegetation.
